Presentation Overview

- Project Scope
- Performance Analysis
- Noise Source Contributions
- Design Modification Plans
- Entrepreneurial Progress
- Gantt Chart

Current Problem

3

Shawn Eckert

- Hair dryers can be very loud
- Causes unwanted noise in areas meant to be peaceful
 - Pet Grooming
 - Salons
 - Household Bathrooms
- ▣ Brands that aren't loud are very expensive; up to \$250+

Project Scope

- Our project scope is to make repeatable and measureable noise reduction improvements to a centrifugal type hand-held hair dryer through enhancements in design aspects, while maintaining performance within 10% of the maximum.

Hair Dryer Components

5

Shawn Eckert

Noise-Flow Tradeoff

- Making alterations to suppress noise results in decreased flow
 - ▣ Examples include: lower fan speed and baffles on intake
- Determine tradeoffs that reduce noise while maintaining flow
- Measure base flow rate and noise before modifications
- Correlate flow and noise analysis

Performance Testing Setup

7

Peter Van Brussel

- Performance based on rate of heat output \dot{Q}
 - ▣ Mass flow rate
 - ▣ Temperature change
- $\dot{Q} = \dot{m} * C_p * \Delta T$
- **Pitot-Tube** to determine velocity profile of jet
- **Infrared Thermometer** to measure temperature of different locations from nozzle

Temperature measurements w/ infrared thermometer

Velocity measurement setup w/ Pitot-tube

Performance Testing Analysis

8

Peter Van Brussel

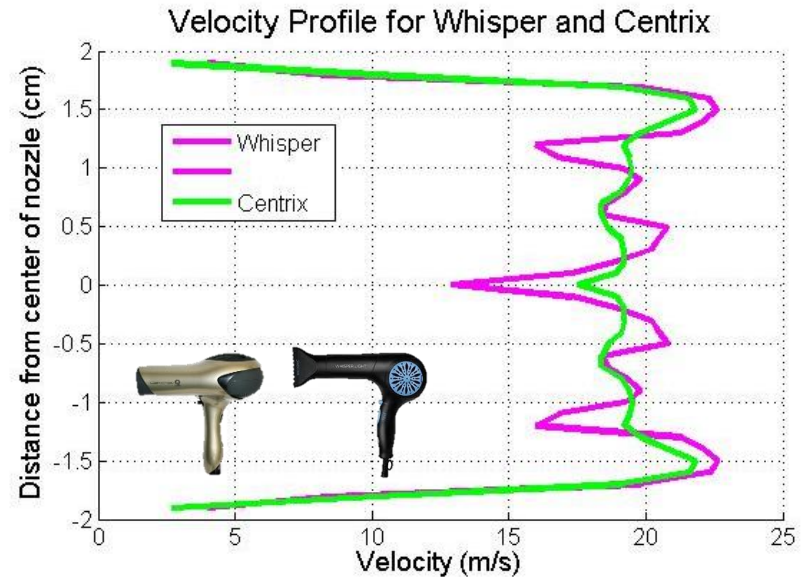

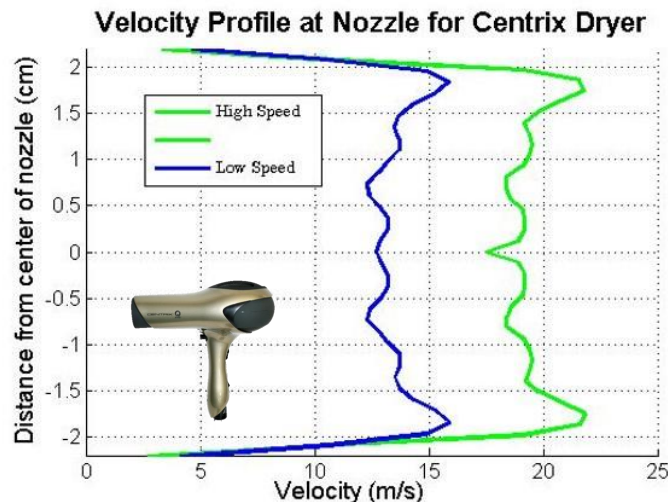

- Integrate velocity profile to determine volumetric flow rate

- $$Q = \int_0^r v(r) 2 \pi r dr$$

- Assumed negligible density and temperature changes in profile

- $$\dot{m} = Q * \rho$$

- $$\rho = 1.225 \frac{kg}{m^3}$$

- Determining ΔT
 - Record surface temperature before and after heat application
- Calculate rate of heat transfer
 - $$\dot{Q} = \dot{m} * C_p * \Delta T$$

Hair Dryer Performance Comparison

9

Peter Van Brussel

	Centrix Q-Zone		Whisper Light	
	High	Low	High	Low
Power Rating	1500 W		1400 W	
Temperature 6 in. from nozzle	55° C 131° F	41° C 106° F	65° C 150° F	50° C 122° F
Volume Flow Rate	0.0284 $\frac{m^3}{s}$ 60 cfm	0.0201 $\frac{m^3}{s}$ 39 cfm	0.0226 $\frac{m^3}{s}$ 50 cfm	0.0142 $\frac{m^3}{s}$ 30 cfm
Motor RPM	514	360	730	520
Heating Rate (\dot{Q})	1190 W	495 W	1227W	508 W

Table comparing performance characteristics of two dryers

*cfm = cubic foot per minute

Microphone Testing Schematic

10

Peter Van Brussel

Top View

Front View

Microphone placements ★

- Measurements take around the device at locations above, level and below
- All measurements taken 10 inches away from nozzle center or top of the intake

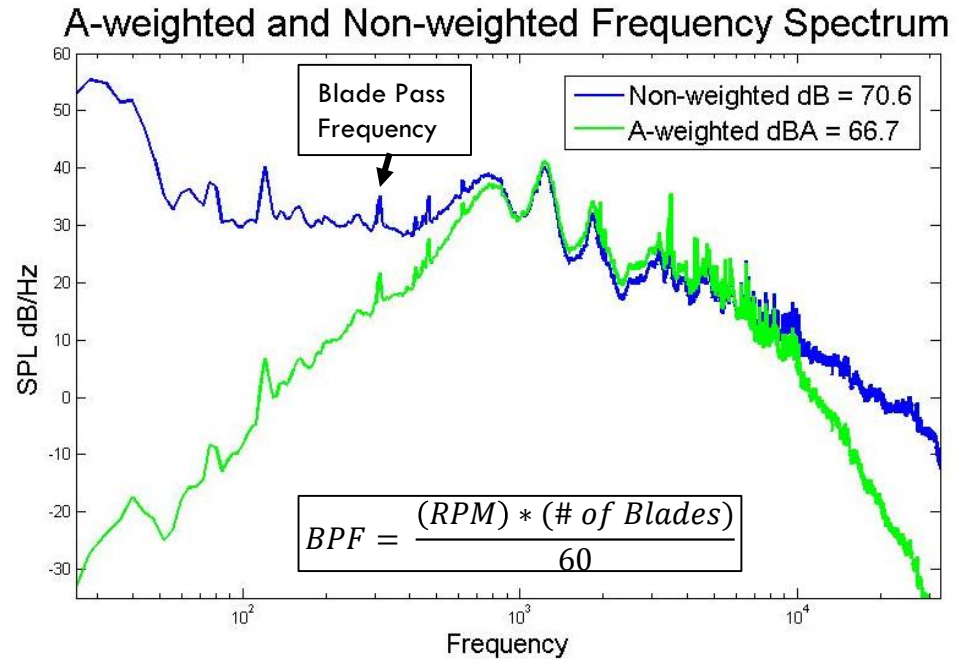

Microphone testing setup in anechoic chamber

Noise Analysis Overview

11

Peter Van Brussel

- Goal is to determine noise sources then determine the greatest contributor
- Human hearing is most sensitive between 1-2 kHz
- A-weighted filter models human hearing
- Design aims are to push noise to lower frequencies to take advantage of A-filter

Frequency spectrum at side of intake for low speed showing behavior of A-weighting filter

- Examine noise contribution of various design aspects
 - Heating Element
 - Intake Covers
 - Fan Speed

Noise Source Contributions

12

Peter Van Brussel

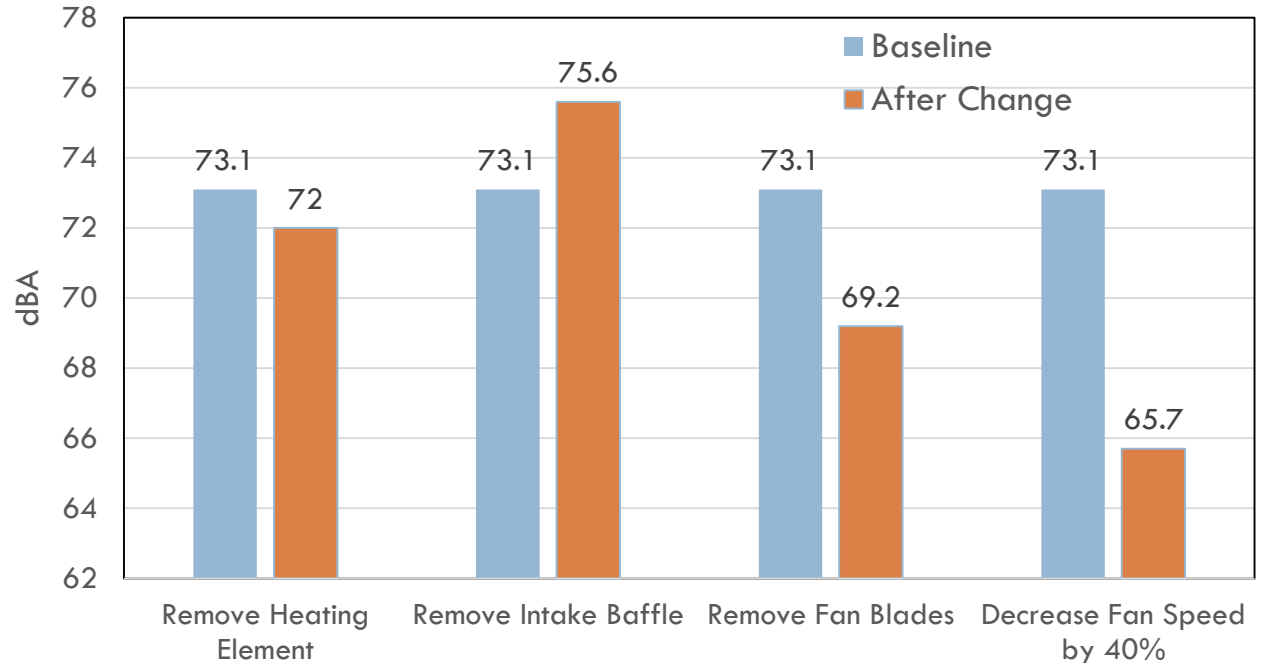

Heating element removed from flow path

Intake baffle removed from flow path

Noise Source Contribution

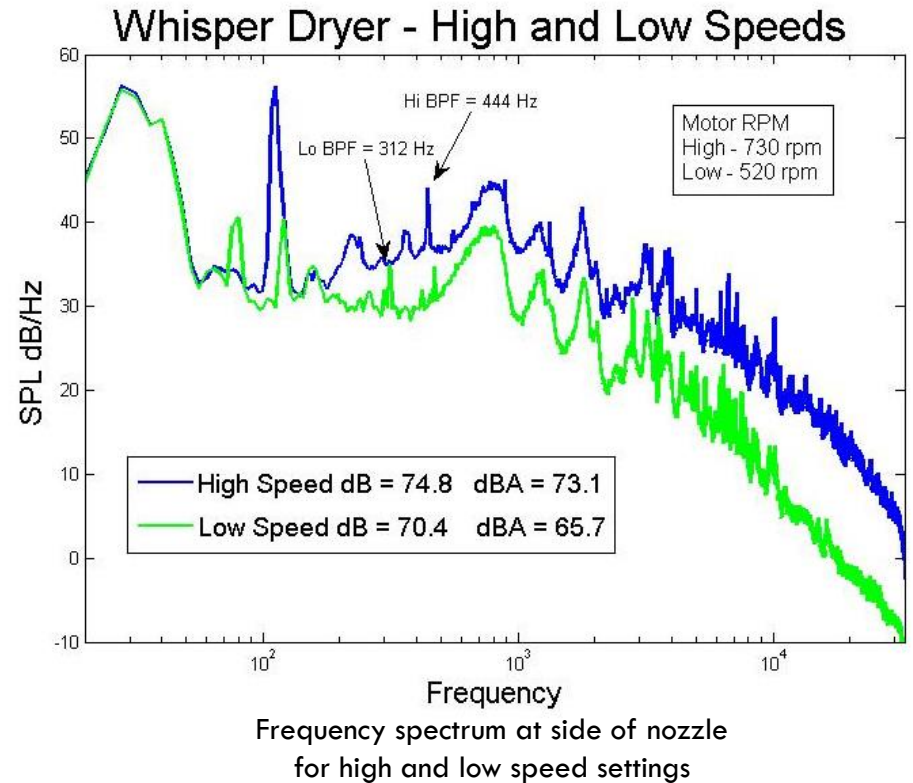

- Heating element noise is minimal
- Baffles are necessary and must be used efficiently
- Fan speed is largest contributor

Fan speed is largest noise contributor

13

Peter Van Brussel

- A 40% increase in fan speed results in a SPL increase of 6-8 dBA
- By far the greatest reduction observed in measurements
- Must effectively balance flow and performance

- Conclusion: Maximum benefit will come from improvements to the fan system and blades

How to modify the fan

14

Peter Van Brussel

- Whisper Light chosen for modifications
 - Simple fan attachment mount
 - Louder of the two hair dryers

- Modifications
 - Reduce the number of blades
 - To decrease BPF
 - Increase blade size and surface area
 - To maintain volume flow
 - Add serrations to blades trailing edge
 - Break up packet of air leaving blades

Showing how the fan attaches to the motor

Fan design

15

Peter Van Brussel

Current fan features

# of blades	36
Blade height	0.935 in.
Outer Diameter	3.05 in.

- Current fan is a “bucket” type design

- 3D printed replica of current fan
 - 1st iteration came out rough but was not designed for 3D printing
- Plan is to 3D print modified designs
 - Looking into more sophisticated methods
- Ensure new fans fit the mount and in the housing
- Use centrifugal fans design references and tools to ensure efficient designs

Entrepreneurial Progress

16

Shawn Eckert

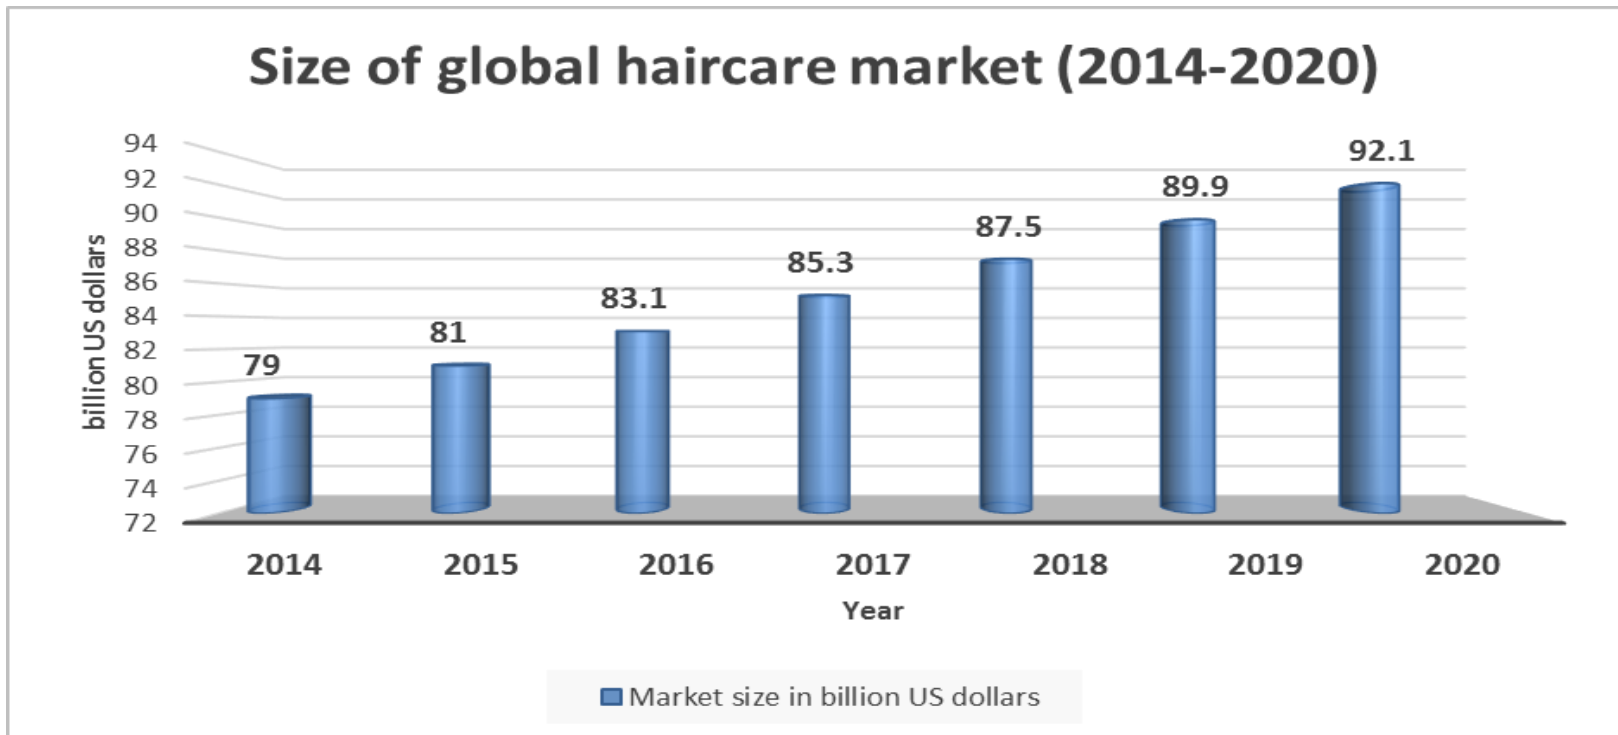

- Global Market
- Potential Customer Survey
- Business Model Canvas
- Engineering Shark Tank

Global Hair Products Market

17

Shawn Eckert

- The hair care market is only going to grow
 - ▣ Shampoos, Conditioners, Relaxers, Gels, Hair Straighteners,...
 - ▣ Most importantly Hairdryers!
- Great time to introduce a product to the market

Hair Styles of Today

18

Shawn Eckert

- Mostly women have been consumers
 - ▣ We expect them to purchase hairdryers
- Men are now becoming consumers
 - ▣ To Complete the look a hairdryer is needed
- Pet groomers are also consumers
 - ▣ Pets with long and short hair
 - ▣ Animals are sensitive to loud sounds

Understanding Customers

19

Shawn Eckert

Desired Customer Improvements

■ Noise ■ Dry Time ■ Tangles ■ Weight ■ Speeds

Desired Pricings

■ Below \$50 ■ \$50 - \$100 ■ Above \$100

Marketing...A Great Product Sells Itself

20

Shawn Eckert

- To be a viable seller in a market full of competitors
 - ▣ It needs to have proven results
 - ▣ A wow factor that isn't just for show
 - ▣ Must set itself apart from the rest
- We aren't Anheuser Busch
 - ▣ Can't afford to spend millions on commercials
 - ▣ Not popular enough to do promotions
