### Group 16

# Design and Development of Optimized Flow Channels for an Alkaline Membrane Fuel Cell Educational Kit

Advisor/Sponsor: Dr. Juan Ordonez

Oluwafemi Ojo Tristan Walter Terry Grandchamps Trevor Gwisz

## **Presentation Overview**

- Project Goal Statement
- Brief Re-Introduction
- Current Design
- Functional Analysis
- Failure Analysis
- Safety Analysis

Group 16

Slide 2 of 22

- Commercialization
- Plans for the Future

## Goal Statement

Deliver a functioning educational alkaline membrane fuel cell kit that demonstrates the effects of flow configurations on the fuel cell's performance by the end of spring 2017 semester"

Group 16 Slide 3 of 22

# Re-Introduction to AMFC Operation

- Converts chemical energy into electric potential energy
- Requires an electrolyte solution, hydrogen gas, and oxygen gas for operation
- Generates pure water and electricity
- No greenhouse gas emitted

Group 16

Slide 4 of 22

Fig. 1: Fuel Cell Operation

# Current Set Up

- 200 mL Electrolysis Cylinders
- 1/8 in diameter exit
- 0.05" Wire to 9V battery
  - Producing a flow rate of 0.2678L/hr
  - Fluid Velocity of 0.036m/s
  - Very low feeding pressure and flow rate
  - Not optimal to study thermal fluids system

Fig. 2a: Electrolysis Cylinder

Fig. 2b: Electrolysis Operation

#### Tristan Walter Design and Development of AMFC Kit

#### Group 16 Slide 5 of 22

# Parallel Configuration

- Lowest pressure drop
  - No minor losses
  - Multi-path design
- Does not require a high flow rate for operation
- Current max voltage 0.561V produced
  - Ideal 1.23V

Group 16

Slide 6 of 22

Fig. 3: Parallel Configuration

### Tristan Walter Design and Development of AMFC Kit

## Serpentine Configuration

Higher pressure drop compared to parallel

- Minor losses-22 bends in current design
- One path continuous flow
- Steady contraction loss

Group 16

Slide 7 of 22

Higher flow rate desired for optimal functionality

Fig. 4: CAD Serpentine Configuration

Tristan Walter Design and Development of AMFC Kit

# Interdigitated Configuration

- Highest Pressure drop compared to parallel and serpentine design
  - Minor losses-22 bends
  - Dead Ends

Group 16

Slide 8 of 22

- Forces fluid to lateral diffuse over channel walls for high diffusion rate
- Potentially flooding
- High pressure drop
- Higher flow rate required for optimal functionality

Design and Development of AMFC Kit

## Effects of Low Flow Rate on High Pressure Drop Configurations

- Heat distribution and Heat transfer
  - Fluid temperature will dissipate quicker through system
  - Max Heat ≈393.15 K (Shown in Fig. 6 in red)
  - Why optimize?
    - Higher flow rates allow for higher heat transfer rates
    - High current density

Fig. 6: Thermal Imaging Interdigitated (left) Serpentine (Right)

#### Tristan Walter Design and Development of AMFC Kit

#### Group 16 Slide 9 of 22

# Effects of Low Flow Rate on High Pressure Drop Configurations

- Low feeding pressure
  - Thermal fluids system has energy losses Head loss
  - Cannot overcome these losses to allow for fluids to move through system
- Low Reynolds number

Group 16

Slide 10 of 22

- Current set up produces RE=0.42
- No empirical formula to find appropriate friction factor
- Cannot study pressure drop in the thermal fluid system

$$f = \frac{24}{\text{Re}} (1 - 1.3553a + 1.9467a^2 - 1.7012a^3 + 0.9564a^4 - 0.2537a^5)$$
 Eqn. 2: R.K. Shah and A.L. London friction factor

Tristan Walter Design and Development of AMFC Kit

Eqn. 1: Reynolds Number

 $\underline{\rho}vD$ 

## Analysis

- How much feeding pressure is required for a respectable flow rate?
  - New velocity selected to received respected RE
    - 6.0 m/s results in RE = 56.45
    - R.K. Shah and A.L. London equation used for f
    - Geankoplis table
    - Geankoplis friction loss
    - ▶ △P=0.1663psi

Table 1: Geankoplis table of friction losses for non-tubulent flow

Re	50	100	200	400	1000	Turbulent
K <sub>f</sub>	17	7	2.5	1.2	0.85	0.75

$$\sum F = \frac{V^2}{2} \left( \frac{4fL}{D_h} + K_f \right)$$

 $\Delta P$ 

Eqn. 3: Geankoplis friction loss (Energy Balance)

#### Tristan Walter Design and Development of AMFC Kit

Group 16 Slide 11 of 22

## Results

- New flow rate of 1.2384 \* 10<sup>-4</sup> m<sup>3</sup>/s (Fluid Velocity = 6.0m/s) results in ΔP=0.1663psi for current serpentine design
- Must produce a feeding pressure > 0.1663psi
  - Increase Electrolysis reaction
  - ► Pump

Tristan Walter Design and Development of AMFC Kit

## Increasing Pressure and Future Steps

#### Increasing Electrolysis Reaction

- Add salt to distilled water in cylinders- increases conductivity
- Thicker wire- increases current
- Use larger battery- increases voltage
- Use pressure gage to measure if this pressure is achievable

#### Pump

Group 16

Slide 13 of 22

- Pump selection will allow for an exact desired flow rate
- Adds more components to system
- Electrolysis method cannot be used

Fig. 7: Pressure Gage used to measure pressure on cylinder

Tristan Walter Design and Development of AMFC Kit

## Design for Commercialization

Kit's main use is for educational use

- Easy to disassemble and replace with different flow plates
- Safe design
- Maximize simplicity and reliability of the design
- Transportability
- All parts and directions included

Group 16 Slide 14 of 22

# Failure Analysis

#### Table 2: Failure Analysis for educational kit

#	Name	Failure Mode	Cause	Symptoms and Local Effects Method of De		Symptoms and Local Effects Method of Detection Effect on Sys		Effect on System	Remarks and other Effects
1	End Plates	Oxidation, Warped, Damaged	Corrosion, Poor Thermal Management, Neglect	Reduced Diffusion, Leaking, Poor Water Vapor Management	Visual Inspection	Reduced Power Generation	Could pose a health hazard		
2	Membrane	Reduced efficiency	Carbon Dioxide Poisoning, Overuse	Uneven Current Distribution	Measuring power output	Reduced Power Generation	Requires Replacement		
3	Gas Delivery Tubes	Cracked, Leaking	Dry rot, Loose Connection	Leaking Gas, Reduced Diffusion	Visual Inspection	Reduced Power Generation	Requires Replacement		
4	Electrolysis Components	No Gas Production	Dead Battery, Poor Electrical Connections	No Bubbling	Visual Inspection, Testing Battery	No Power Generation	Requires Replacement		
5	Electrode Sheets	Salt Build Up, Damaged	Carbon Dioxide Poisoning, Misuse	Uneven Current Distribution, Uneven Heat Distribution	Visual Inspection, Power Output	Reduced Power Generation	Requires Replacement		

# Safety Analysis

- AMFC operates at max temperatures of 100°C 120°C
- Improving design to make more stable
- Prevent fuel cell from moving during operation

Fig. 8: CAD drawing of fuel cell stand

Group 16

Slide 16 of 22

Fig. 9: CAD drawing of fuel cell in stand

# Maximizing Simplicity

- Old design relied on bolts for assembly
- New design assembled with quick release bicycle skewers
- Skewers will be customized in order to fit design

Fig. 10: Current design using bolts

Fig. 11: Quick release skewer

Fig. 12: CAD drawing of new design

Trevor Gwisz Design and Development of AMFC Kit

Group 16 Slide 17 of 22

# Maximizing Testing Reliability

- Old Design relied on spliced wires to measure power generation
- Could produce inconsistent measurements
- New Design features integrated connection points to facilitate alligator clips

Fig. 13: Current design wiring system
