## Tribometer in Spacelike Conditions

VDR1 231017

# Team Introductions

**Branham Channell**  
Materials Engineer

**Cobi Johnson**  
Systems Engineer

**Madison Retherford**  
Mechatronics Engineer

**Javier Ibanez**  
Structural Engineer

**Joshua Wesley**  
Computer Hardware Engineer

# Sponsor and Advisor

**Dr. Brandon Krick**

**Dr. Shayne McConomy**

# Objective

The objective of this project is to design, develop, and implement a system that enables the simultaneous testing of multiple samples within a vacuum chamber using a tribometer. This system aims to increase testing throughput and enhance overall efficiency while maintaining prior accuracy and control.

# What is a Tribometer?

Tribometers measure quantities such as coefficient of friction, friction force, and wear volume on two surfaces in contact by simulating friction in controlled conditions.

# AME's Vacuum Chamber

- Vacuum chambers work by removing air and gas from a vessel using a pump.
- The lab's is a bell-style high-vacuum chamber.
- It can reach pressures as low as  $1.5 \times 10^{-6}$  mbar.

# Steps to High-Vacuum

## Step 1

- Roughing pump pulls initial vacuum on system.
- This "rough vacuum" is around  $10^{-1}$  to  $10^{-2}$  mbar.

## Step 2

- Switched to the much stronger cryo-pump.
- Takes vacuum down to  $10^{-5}$  mbar quickly.

## Step 3

- Let sit overnight (or at least 12 hours).
- Achieves  $10^{-6}$  mbar range.

# Key Goals

Test multiple samples

Control parameters

Operate in specific conditions

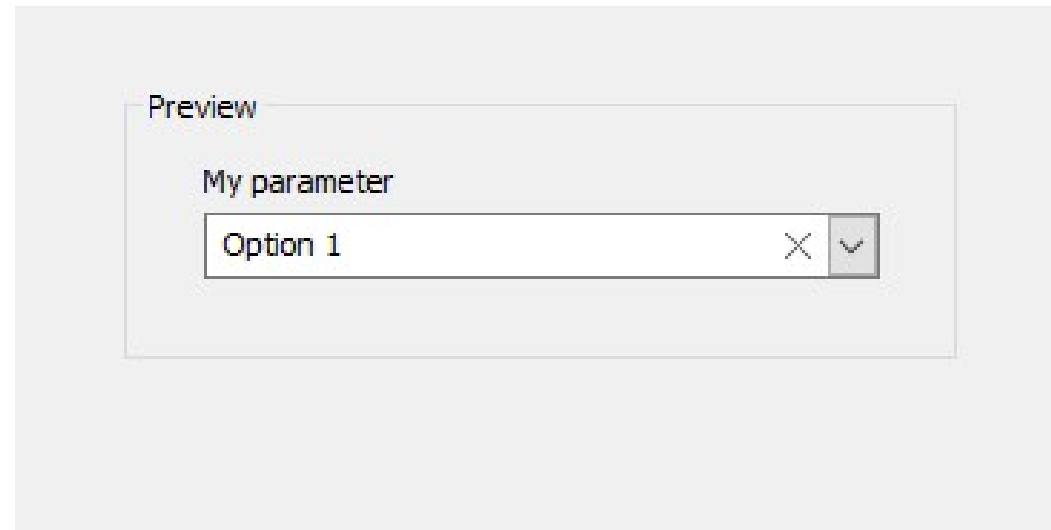

# Key Goals

Test multiple samples

Control parameters

Operate in specific conditions

# Key Goals

**Test multiple samples**

**Operate in specific conditions**

# Primary Market

**LOCKHEED MARTIN**

# Secondary Market

# Tertiary Market

**Dr. David Larbalestier**  
Chief Materials Scientist of the National High  
Magnetic Field Laboratory

**Dr. Lance Cooley**  
Director, Applied Superconductivity  
Center

# Assumptions

Test will be run by individuals with proper training.

Materials that will be tested are polymers and coating.

High-vacuum chamber will be provided.

Applied load and temperature will not be tested outside of the established range.

# Customer Needs

# Customer Needs

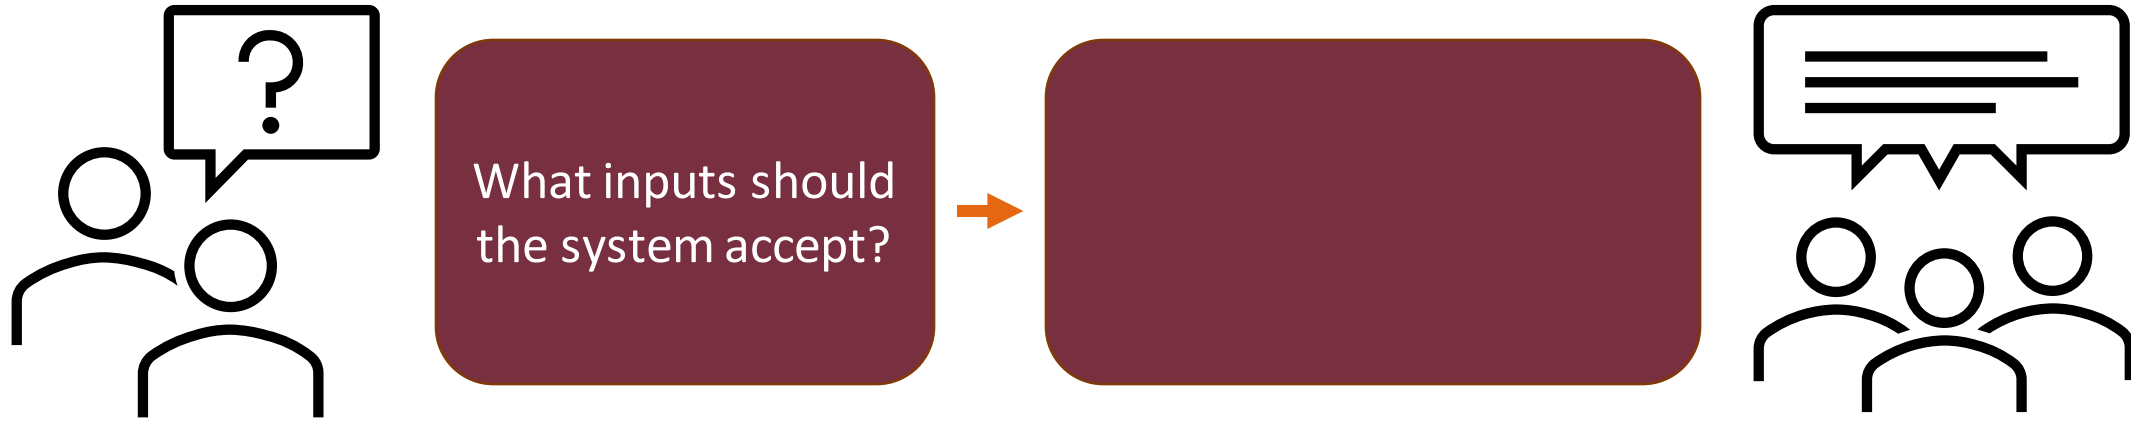

# Interpretation

The system tests multiple samples simultaneously.

# Customer Needs

# Customer Needs

Temperature, contact stress, displacement of sample during slide, and number of samples tested.

# Interpretation

The system reads in and store inputs.

# Customer Needs

What would you like the system to determine for you and output?

# Customer Needs

Temperature, contact stress, displacement of sample, coefficient of friction, and wear rate.

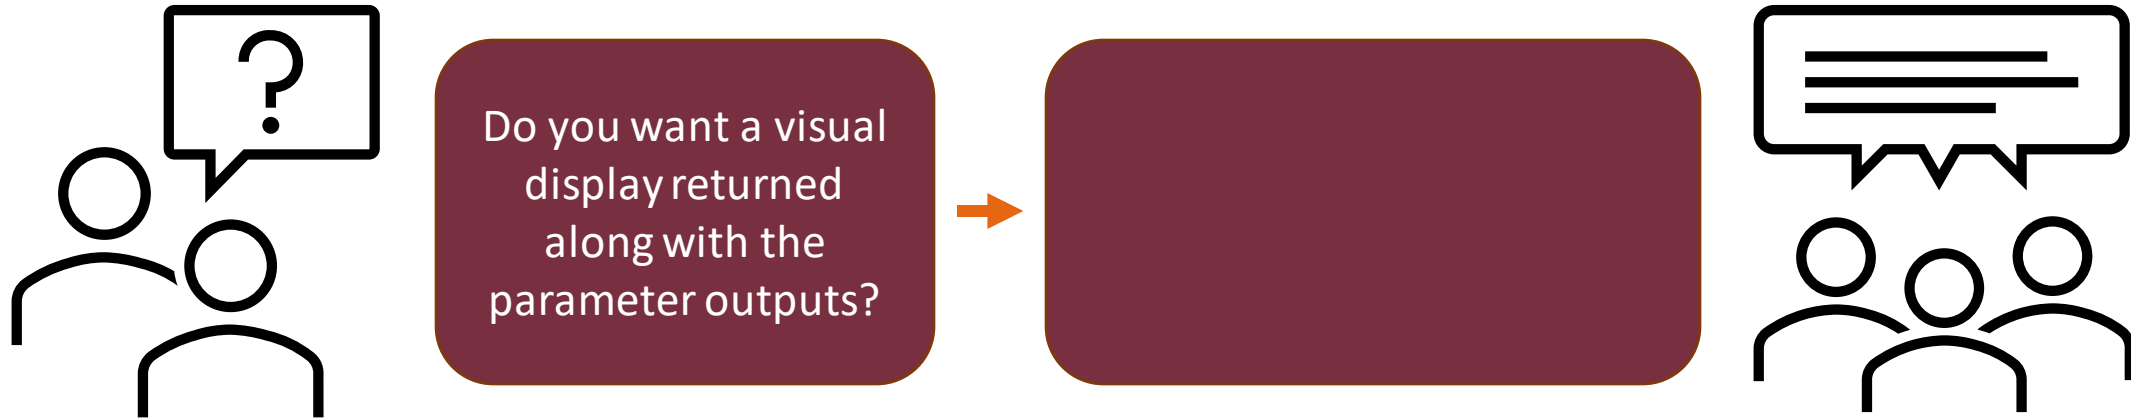

# Interpretation

The system returns outputs and critical targets from test results.

# Customer Needs

# Customer Needs

A graphical user interface (GUI) exists in MATLAB, design should be compatible with this GUI.

# Interpretation

The system is compatible with the previous graphical user interface.

# Customer Needs

# Customer Needs

Our chamber will only reach high-vacuum.

# Interpretation

The system can operate under high-vacuum conditions.

# Customer Needs

# Customer Needs

No, the system only needs to fit in the vacuum chamber and work under its pre-set conditions.

# Interpretation

The chamber needs no modification.

# Customer Needs

# Customer Needs

To test the same material under different conditions, different contact stresses must be applied to each sample.

# Interpretation

The system can apply different inputs to different samples.

# Customer Needs

What do you consider a success for this project?

# Customer Needs

Minimum: single sample prototype that can be expanded in the future.  
Great success: functional model that can test four to six samples.

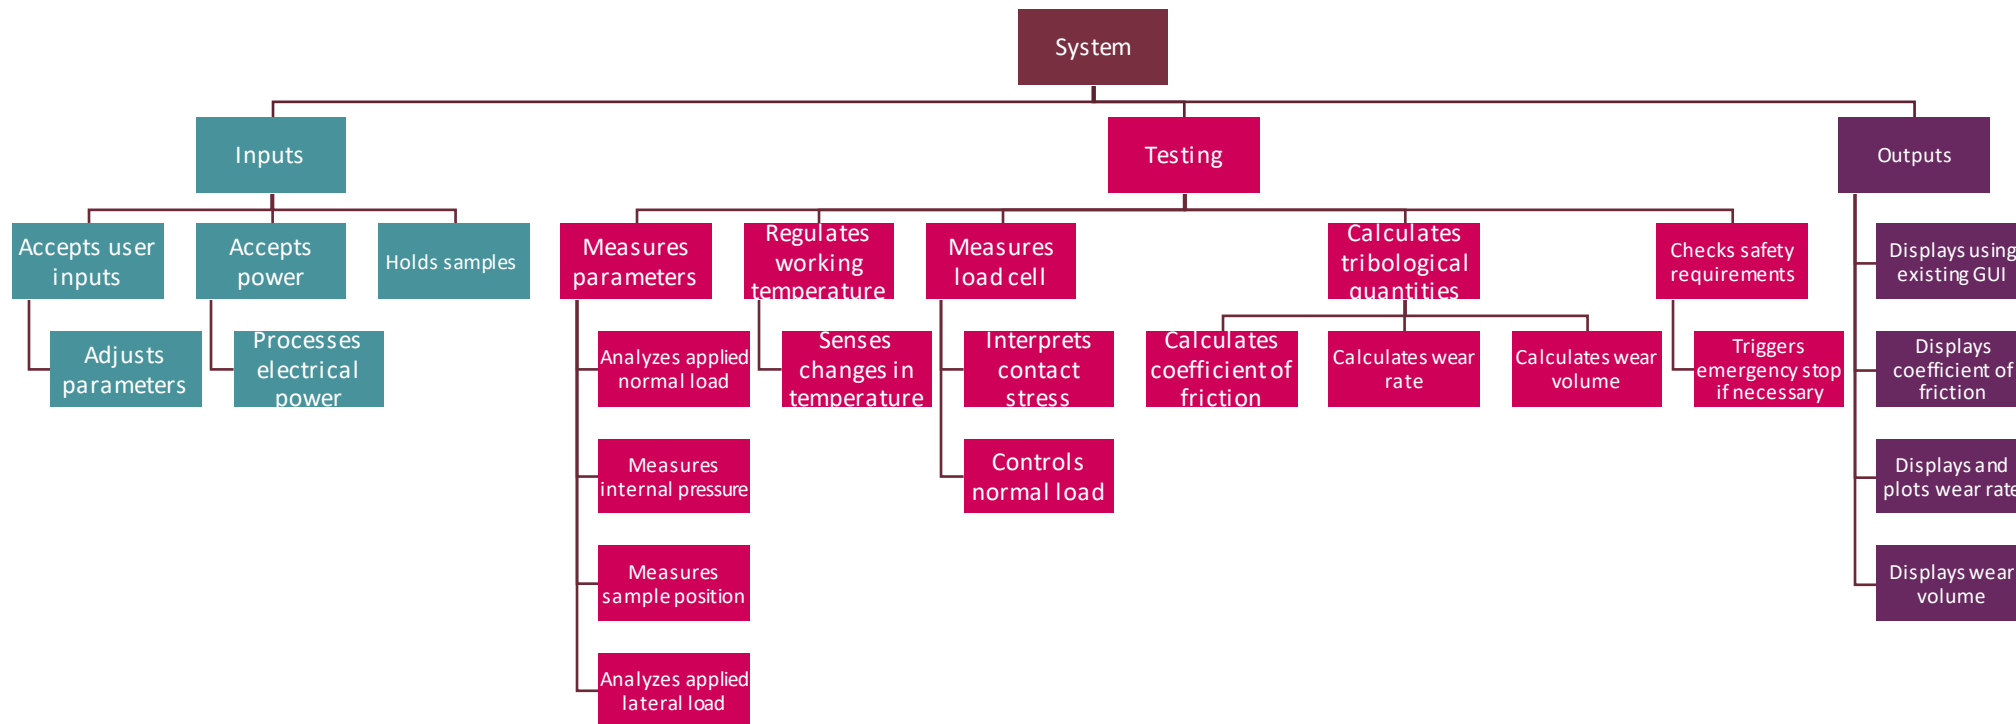

# Interpretation

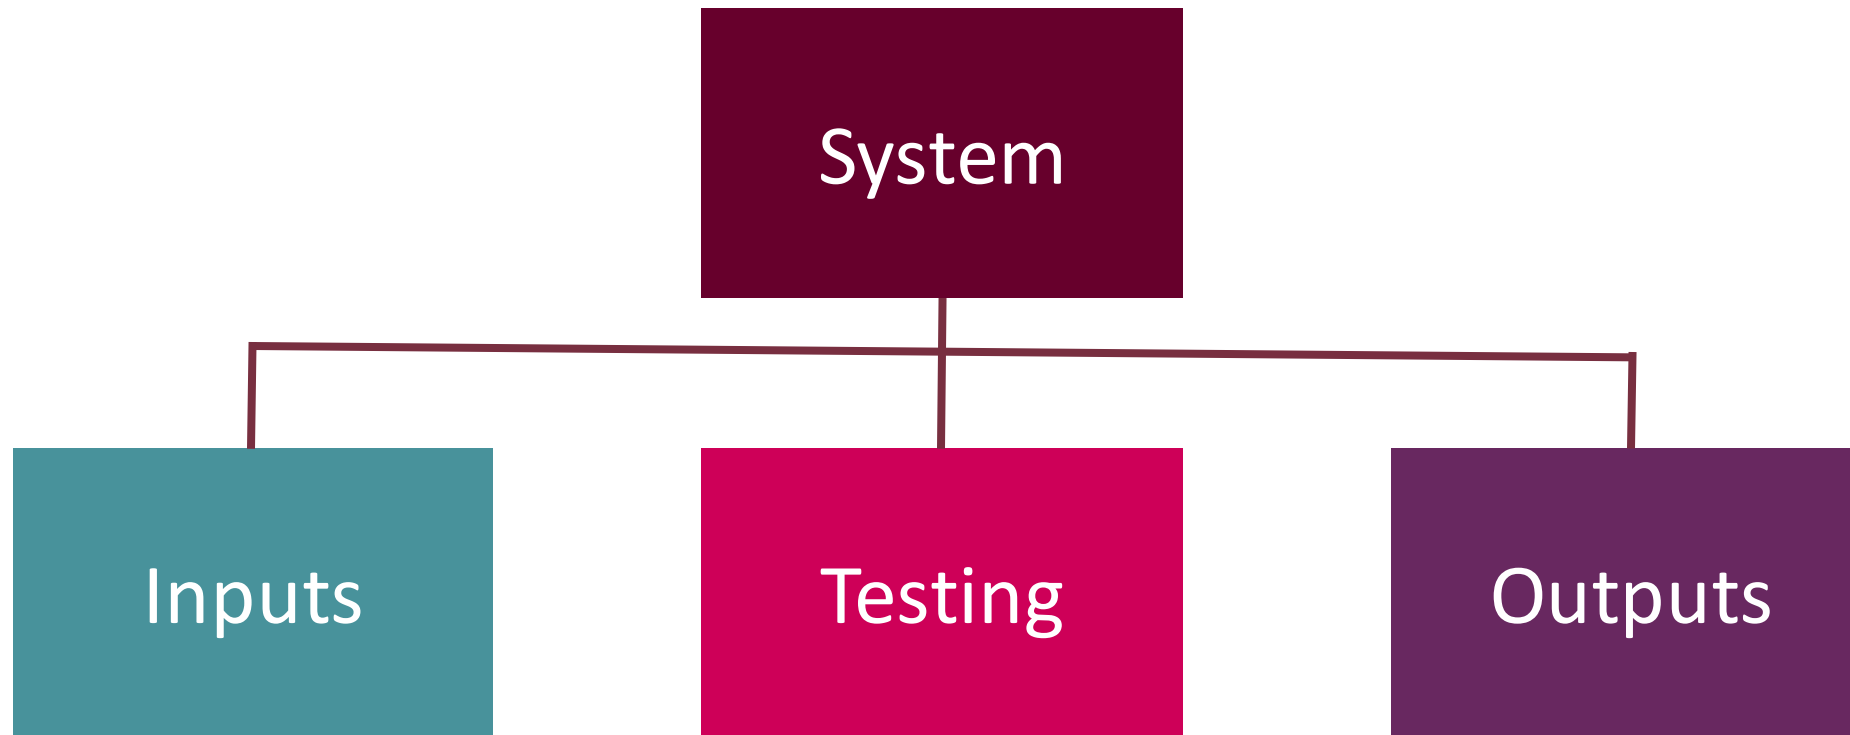

The system can test at least one sample, but ideally four to six.
